

2737. Find the Closest Marked Node Premium

Solved ●

Medium  Topics  Hint

You are given a positive integer n which is the number of nodes of a **0-indexed directed weighted** graph and a **0-indexed 2D array** `edges` where `edges[i] = [ui, vi, wi]` indicates that there is an edge from node u_i to node v_i with weight w_i .

You are also given a node s and a node array `marked`; your task is to find the **minimum** distance from s to **any** of the nodes in `marked`.

Return an integer denoting the minimum distance from s to any node in `marked` or -1 if there are no paths from s to any of the marked nodes.

Example 1:

Input: $n = 4$, `edges = [[0,1,1],[1,2,3],[2,3,2],[0,3,4]]`, $s = 0$, `marked = [2,3]`

Output: 4

Explanation: There is one path from node 0 (the green node) to node 2 (a red node), which is $0 \rightarrow 1 \rightarrow 2$, and has a distance of $1 + 3 = 4$.

There are two paths from node 0 to node 3 (a red node), which are $0 \rightarrow 1 \rightarrow 2 \rightarrow 3$ and $0 \rightarrow 3$, the first one has a distance of $1 + 3 + 2 = 6$ and the second one has a distance of 4.

The minimum of them is 4.

Example 2:

Input: $n = 5$, `edges = [[0,1,2],[0,2,4],[1,3,1],[2,3,3],[3,4,2]]`, $s = 1$, `marked = [0,4]`

Output: 3

Explanation: There are no paths from node 1 (the green node) to node 0 (a red node).

There is one path from node 1 to node 4 (a red node), which is $1 \rightarrow 3 \rightarrow 4$, and has a distance of $1 + 2 = 3$.

So the answer is 3.

Example 3:
